information

Company "Aman GreenFood" offers to the consumer a high-quality natural product by means of maintenance of ecological compatibility of production, and also introduction of the advanced industrial technologies answering to requirements of the international norms of food safety. For this reason, the company applies principles of the international system of safety of food production HACCP in a production cycle.

In order to optimize the processes of quality control of purchased raw materials, a laboratory was purchased and installed on the basis of the company. The laboratory has all the necessary equipment for testing and obtaining reliable analyses.

- Sampling;
- Organoleptic characteristics of honey - color, taste, smell;
- Physico-chemical indicators: total acidity, diastase response, diastase number, humidity, inverted sugar
- Falsification tests - adding sugar syrup, flour, starch, etc.
- Pollen analysis

"In our activities, we strive to create ecological and only natural products, giving everyone the opportunity „ to be in harmony with nature."

Honey and honey products from Aman GreenFood are natural gifts of the unique nature of mountainous Kyrgyzstan. Mountains of Kyrgyzstan are rich in the purest mountain plants with exceptional medicinal and healing properties, which are so holistically and harmoniously preserved in beekeeping products.

Aman GreenFood started its activities in 2013, and today many work processes are optimized and put on stream.

We have permanent sales markets, both local and international.

One of the peculiarities of the company is a clear control of the production cycle, from the beginning to the end.

The entire process, from the organization of hives at the honey collection sites, through the honey collection process, through the filtration, filling and packaging process, to the storage of finished products, is under the proper supervision of specialists.

At present, the products are exported to neighboring and far-abroad countries and are in great demand, as the Kyrgyz mountain honey is among the best honey varieties in the world.

Thanks to the efforts of the company, beekeeping products of Kyrgyzstan found its buyer in the markets of China, South Korea, the Gulf States, won the trust of a demanding Japanese buyer, as well as gained the trust of consumers of honey in the United States.

"Aman GreenFood is the only company in Kyrgyzstan that conducts pollen analysis of the main types of honey. In cooperation with the Institute of Geology of the Ufa Scientific Centre of the Russian Academy of Sciences (RAS) under the leadership of R.G. Kurmanova, the company initiated and introduced pollen analysis of the main types of honey into production.

The presence of pollen analysis gives a significant advantage to the Company as a reliable partner that cares about the quality and composition of the proposed honey.

Pollen analysis allows tracking the exact composition of honey, which is reflected in the marketing strategy, positioning and selection of target markets.

As a result, the company has received unique and exceptional data on pollen analysis of honey, its own production. Thus, we discovered two types of monofloral honey, which are rare in our region:

- Thyme monofloral honey - 70% Thyme percentage
- Monofloral Sage honey - from 37% of the percentage

To get such honey, need special natural and climatic conditions that make these two types of honey unique and distinguish them in the category of "Premium".

"We are studying the properties of honey and bee products, strengthening their quality by developing new honey products that help improve human health."

ANGELS' GIFT

Thyme

Monoflor honey

Having the opportunity to carry out pollen analysis in our own laboratory, our company managed to obtain exceptional data on the pollen composition of local premium honey types. Thus, we are honored to present you the unique Angels' Gift Thyme monofloral honey, which features a **70% share of Thyme** (Thymus). Monofloral, Thyme honey is a product that is particularly valuable today all over the world. The product has gained popularity due to its healing qualities, unique taste and compatibility with many products.

It is a powerful antioxidant that neutralizes free radicals causing diseases such as cancer, cardiovascular and metabolic disorders. Valuable elements included in the product have a beneficial effect on the human body, quickly getting rid of many dangerous diseases. This beekeeping product has three key groups of beneficial properties: antioxidant, anti-cancer and hypoallergenic.

ANGELS' GIFT

Sage

Monoflor honey

This kind of bee nectar is able to give a real taste of pleasure to lovers of sweets and delicacies

Angels' Gift Sage is derived from honey nectar with blue-violet flowers of perennial shrubs in mid-summer. Wild sage varieties can be found in the foothills and in all regions of Kyrgyzstan, especially in the southern regions.

Sage flowers do not have a strong aroma, but are popular with bees. However, sage honey itself, monofloral honey, has a very pleasant smell, amber-gold color, subtle flavor and hardly noticeable mustard.

In addition, the distinctive feature of sage honey is its liquid consistency. The product practically does not crystallize, so even in winter it is a viscous aromatic liquid without any crystals and inclusions.

This kind of honey contains a lot of essential oils, tannins, minerals, vitamins, organic acids. In addition, it contains alkaloids and flavonoids. List of vitamins: **B1, B6, B2, B9, PP, N, C**, etc.

WHITE HONEY

Sainfoin

Monoflor honey

White Honey - has a pearl white color and delicate floral flavor. White honey varieties are obtained by collecting nectar only from certain species of honey plants and are monofluoric, so that such honey has hypoallergenic properties.

Sainfoin hill | At-Bashi Region, Kyrgyzstan

Every DROP of honey is flavor of million flowers!

White Honey is harvested from sainfoin flowers in the mountains of At-Bashy, Naryn region of Kyrgyzstan, which is one of the highest mountainous areas of the country, and is famous for such organic products as yak meat, mountain currant, mountain ash, mountain ash and sea buckthorn.

Esparcet grows in an exceptionally ecologically clean zone, because agriculture is poorly developed at the local level due to the high mountains, and therefore the use of pesticides harmful to bees in the agricultural production of the area is almost zero. The consistency of honey is creamy and the taste is delicate and uninhibited.

FOREST HONEY

Polyflor

Gold medal for the best mountain honey
2014 at the 22nd Universal Fair

Bishkek, Kyrgyzstan.

Forest Honey is mined at the Jalal-Abad region copper-bearing base, which allows for the production of honey in large quantities and of high quality. Toktogul is famous for its high-mountainous jailoo (pastures), where more than a hundred medicinal plants grow. During the blossoming period, people with poor health can get rehabilitation therapy by simply inhaling the aromas of local herbs. It is from these flowers that the famous Toktogul honey, which has been giving health to people for centuries, is collected. Foreign tourists often stay for several days on the Great Silk Road in Toktogul, in mountain gorges, on the banks of glacial rivers and crystal clear streams, watching, how tens of thousands of hard-working bees spin under the warm rays of the summer sun over purple bells, fragrant St. John's wort, tender sainfoin, medicinal plantain, fragrant wild raspberry and mountain currant, pollinating wild apples, cherry trees, rose hips, and collect the treasured gift of nature for mankind.
